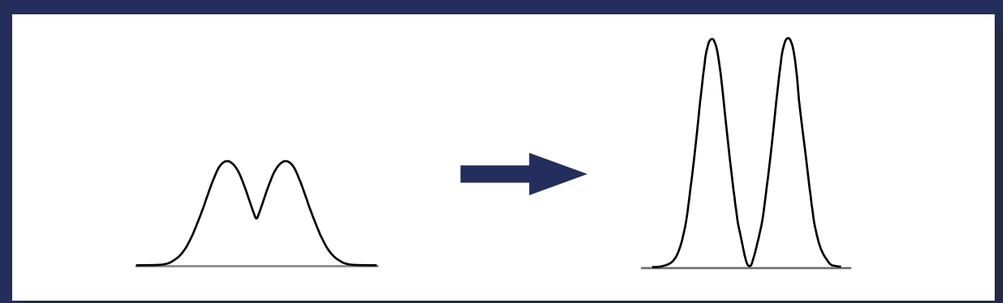
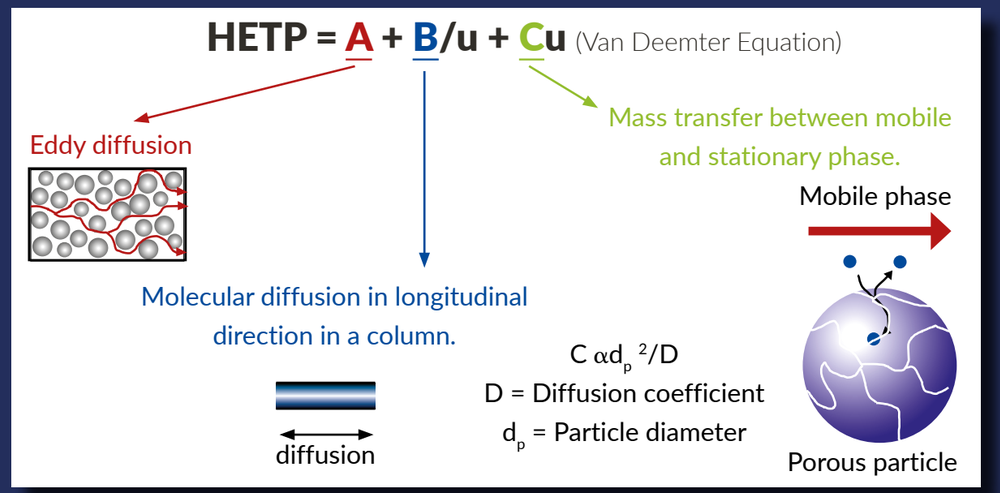
REPROSHELL

Core - Shell pharticles

Core-Shell particles consist of a solid (non-porous) core surrounded by a porous layer (shell). They exhibit the same back pressure but higher efficiency compared to fully porous particles of the same particle size.



ReproShell – van Deemter Equation



van Deemter Plot

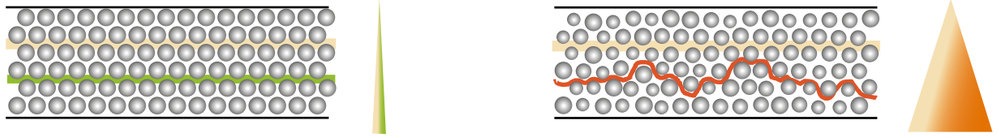
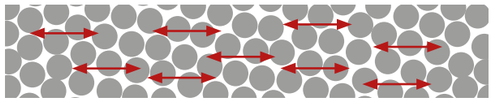
A-TERM (EDDY DIFFUSION, MULTI-PATH EFFECT)

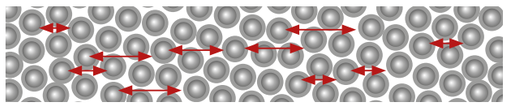


Core-Shell particles have a tighter particle size distribution which leads to a more uniform, organised bed structure. This reduces the impact of the multi-path effect.

B-Term (Longitudinal Diffusion)

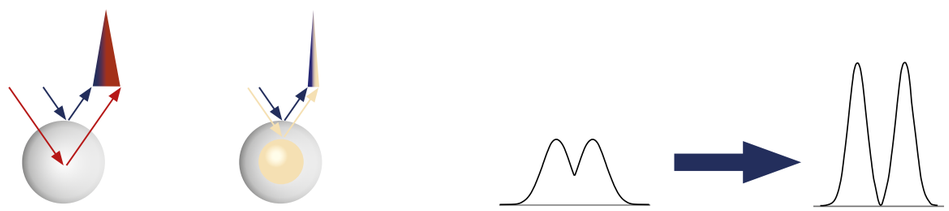


Fully porous particles:
Diffusion takes place within the porous particle as well as in the interstitial space



Core-Shell particles:
Non-porous core blocks longitudinal diffusion

C-Term (Mass transfer)



The non-porous core leads to a shorter diffusion path
